Learning Goals

- Process unclean data, describe datasets with metadata, and apply fair data principles
- Validate and assess uncertainties of models
- Test hypotheses and verify the underlying assumptions
- **Develop** clear and efficient **code** in Python, integrate user interaction, and keep track of versions

Outline

Flowcharts

Handout of assignment

Exercise

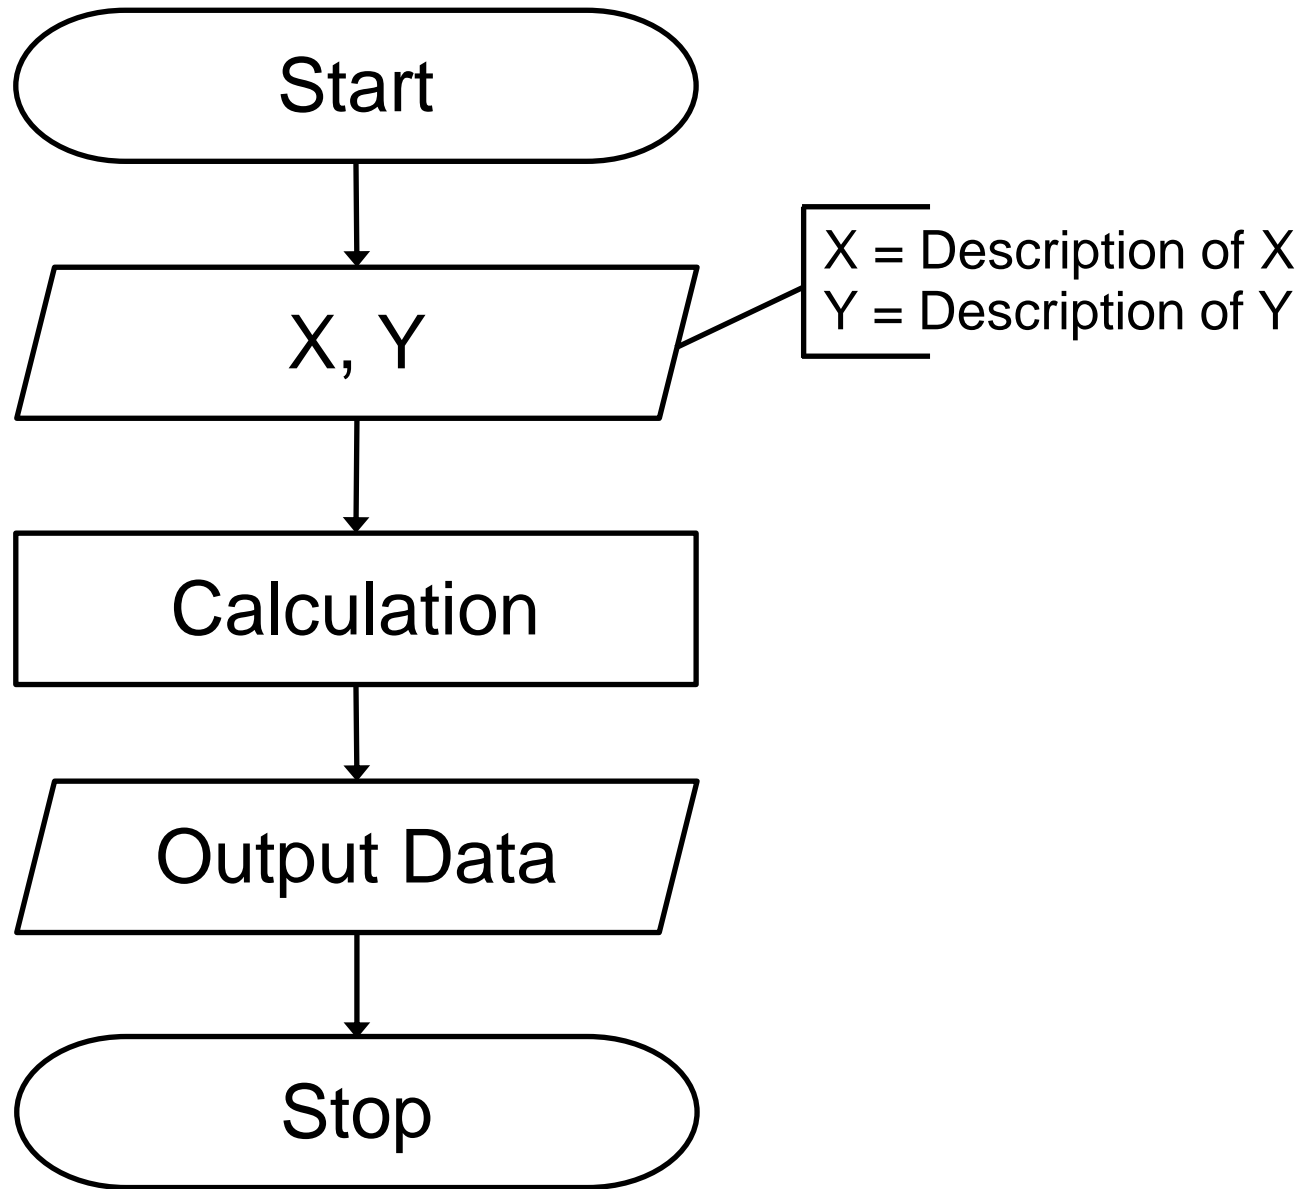

Software Development

- 1) Design, e.g., using **flowcharts**
- 2) Implementation, e.g., using Python
- 3) Testing
- 4) Documentation (→ lecture 5)

Flowchart

→ Design and documentation of the computer programme

Exercise

Assignment

Group A

Research question: Are social and environmental sustainability indicators correlated, and is there rather a **trade-off** or a synergy between the two?

Main analysis: **hypothesis testing**, including testing assumptions (→ Lecture 2)

Group B

Research question: How well do countries perform regarding sustainability, and does the overall **distribution** change if more countries are considered through imputation?

Main analysis: Imputation, including **validation** (→ Lecture 3)

→ Indicate your preference for a group [here](#) and sustainability-related indicators [here](#) (A) or [here](#) (B)

Assignment

Expected skills practiced more: Using Python for function definitions, loops, conditions, reading and writing to files, and plotting.

- Work with **pandas** data objects (→ Lecture 1).
- Write **nice** code (→ ESSA Lecture 5, slide 9).
- Use Python for developing Python **modules**, i.e. create a separate script for functions that is sourced in the main script (function: import, script name without extension).
- Integrate a **GUI** element (→ Lecture 4).
- Track your code changes with **git** (→ Lecture 2).
- **Document** your code according to a standard style (→ Lecture 5).
- **Profile** your code to find slow sections and potentially **optimize** them (→ Lecture 5).
- Work in a **virtual environment** (→ Lecture 1).

Assignment

Data from the World Bank can be found [here](#).

Submission: Hand in on **Brightspace**

See deadlines in assignment instructions, course schedule in introduction lecture slides, and on Brightspace.

See deliverables (more than just the Python scripts) and assessment rubrics (more than just a working code) in assignment instructions.

Outline

Flowcharts

Handout of assignment

Exercise: Draw a flowchart for the assignment of group A or B

Group A – Trade-offs

In a nutshell:

- Input: 3 environmental and 3 social indicators
- Filter selected country
- Verify test assumptions
- Choose either Pearson or Spearman correlation analysis
- Run correlation analysis
- Output: trade-off or synergy

Flowchart for group A

Group B – Distribution

In a nutshell:

- Input: primary and secondary indicator
- Filter a recent year
- Impute data
- Validate imputation
- Segment data
- Output: imputation performances
- Output: distribution

Flowchart for group B

Key Issues to Keep in Mind

Based on common mistakes in exams

- Draw **flowlines** with arrow heads that indicate the direction of the flow.
- Use the right **symbology**, as it gives additional information.
